Login VSI Enterprise Edition

Prevent Performance Problems with Login VSI and Login PI

A 'good or better than' user experience is a critical success factor for all SBC, VDI and DaaS/SaaS deployments. Login VSI is the market leader in synthetic load testing and pro-active monitoring and offers a complete software solution to build and safeguard the optimal performance, scalability and availability of virtual desktop environments.

Login VSI is 100% vendor-independent and works perfectly with VMware Horizon, Citrix XenDesktop, Citrix XenApp and Microsoft Remote Desktop Services (RDS). Also users and providers of DaaS and SaaS cloud-solutions such as Microsoft Azure, Amazon Web Services and many others, will benefit from our easy to install, easy to use solutions.

Login VSI Enterprise Edition

For all organizations using centralized virtual desktop environments to provide productivity- and business applications to their end-users, we offer the Login VSI Enterprise Edition, the complete solution to protect VDI performance and availability.

Login VSI's Enterprise Edition offers a unique combination of Login VSI's synthetic load-testing and Login PI's pro-active monitoring capabilities, helping enterprises to design, build and maintain VDI environments that provide an optimal End-User Experience.

Login VSI Enterprise Edition is especially suited for:

Building a well performing VDI or RDSH Infrastructure

The Load Testing capability of the Login VSI Enterprise Edition helps to build well-performing virtual desktop infrastructures. Login VSI is used in the design and build phases for benchmarking, sizing/scaling and pre-production load- and stress-testing.

Application Performance Management

In virtual desktop production environments, end-user experience is the key concern. Login VSI Enterprise Edition helps to safeguard performance and availability of your productivity and business applications: regardless of if they run on-premises (using VDI or server based computing) or elsewhere (using SaaS, DaaS or IaaS).

Change Impact Validation

In virtual desktop production environments, most problems are caused by changes. These can be planned changes such as new versions of business applications, regular builds of Windows 10 or standard weekly updates, as well as unplanned changes such as automatic updates. But also just normal daily use can cause a gradual deterioration of desktop and application performance due to the pollution of storage and other devices. The Login VSI Enterprise Edition is the only complete solution in the market today to help organization to prevent potential performance issues due to any kind of change.

VMware Horizon • Citrix XenDesktop • Citrix XenApp • Microsoft RDS

Remote User Testing

Your virtual desktop users work from different locations - and while you strive to deliver the best possible user experience, there are many external factors that can have a negative impact. For example, the distance to the datacenter, the speed and quality of the internet connection, as well as other bottlenecks along the way, can produce support tickets even though the desktop environment in your data center is running smoothly. Login VSI Enterprise Edition helps to actively monitor the remote location performance.

Service Level Agreement Verification

While the use of on-premises VDI is still growing, there is also a strong move towards cloud based solutions for desktops and/or applications. Industry analysts especially recommend cloud based solutions like DaaS and SaaS for environments where most end-users have very short term engagements, and where the applications used are relatively light weight. Login VSI Enterprise Edition helps to validate and enforce SLA's.

Login VSI for Load Testing

Login VSI is the industry standard load-testing tool for virtual desktop environments. Login VSI will generate a large number of synthetic users to test, and to protect, the performance and scalability of new and existing SBC, VDI, and DaaS/SaaS deployments.

Login VSI is available to end-user organizations as a key component of the Login VSI Enterprise Edition, Login VSI is available to IT vendors as our Login VSI Vendor Edition.

Login PI for Active Monitoring

The Login PI active monitoring solution uses synthetic users running 24/7, to monitor and safeguard the optimal performance and availability of your own (or outsourced) virtual desktop infrastructure and associated business applications. Login PI is available to end-user organizations as a key-component of the Login VSI Enterprise Edition.

Login PI tests, measures, and alerts you on every change that affects the performance of desktop and application logon's, and of the actual tasks-in-an-application processing. Login PI also provides information about protocol latency and network performance.
